The Last of the Australian Line

The last steamer of the Australian line has come into port, and with this event the operations of the line may be considered at an end. The enterprise was an experiment, and the projector, W. H. Webb, is probably out of pocket a sum equal to a pretty large fortune. The manager did not lack pluck nor enterprise. He has built some of the

The Sevier Lake Monsters.

The Sevier Lake is about forty miles long by fifteen wide; its waters contain about the same proportion of salt as common sea water, and is distant from the now Sevier mineral district about ten miles. This lake is one of those beds of water which the traveler over and anon comes across in traveling between the mountain regions lying between the prairie and the Pacific slope, and although in Utah and adjacent

Territories they seem to be more numerous, and from a more definite connection in the chain, which goes to prove that what is now the fertile fields of Utah was once the bed of an immense inland sea. But independent of their existence this later proposition can scarcely be doubted, as the water-line is plainly defined along the sides of our mountain ranges, while the side hills are but the deposits rolled up from the depths by the waves that once lashed the sides of the rugged cliffs, which still bear evidences of their power. This fact once established, and it requires but little stretch of the imagination to conceive, or of the conscience to admit, that the Bear, Salt, Utah, Provo, Sevier and other lakes, are but the remaining deposits of water left here and there by the receding sea, when rolled back in compliance with Nature's immutable laws. That those lakes should contain the progeny of the original inhabitants of the great desert sea is equally admissible; and that the ocean contains huger animals and natural monstrosities is everywhere admitted.

Their existence then in our lakes would be nothing particularly strange or startling if proven true, although it must be admitted it would be a very interesting fact when taken in connection with the supposed source of their origin.

The veracity of the gentlemen who recently returned from a visit to the Soviet country, who rode miles along the lake shore and report seeing several of these monsters of the deep sporting in the waters, is not questioned by those who have known them for years and who are alike truthful. The largest monster seen was supposed to be, without exaggeration, about fifty feet long by about twenty in circumference, and is back, as it sported and spouted, was plainly visible some ten feet above water. Others, of apparently less dimensions, were seen in the distance simply amusing spectators.

The Indians who inhabit that country are said to be aware of their existence, and have become so terrified by the evidences of their own senses, as well as the traditions of their fathers, that they cannot be induced to go near the lake on any pretext.

Undoubtedly, as is reported, a new and rich mineral district has been discovered on the Sevier, the evidences already given will be long be numerously confirmed by those whose business calls them to the immediate neighborhood. Indeed, it would be an interesting subject for investigation to those to whom time is no object, independent of any other consideration.—*Salt Lake Tribune.*
